[View Forum Message](#) <> [Reply to Message](#)

---

Dear all,

Today we released the new external packages (sep12) for FairRoot.

The release was tested on:

MAC OS X 10.6.x with gcc 4.2.1 (64 bit)  
MAC OS X 10.7.x with gcc (64 bit)  
MAC OS X 10.8.x with llvm-gcc 4.2 (64 bit)  
MAC OS X 10.8.x with clang 4.0 (64 bit)  
Suse 12.1 with gcc 4.6.2 (32 and 64 bit)  
Suse 12.2 with gcc 4.7.1 (32 and 64 bit)  
Fedora 17 with gcc 4.7.0 (32 and 64 bit)  
Ubuntu 12.04 with gcc 4.6.3 (32 and 64 bit)  
Debian Squeeze with gcc 4.4.5 (64 bit)

For more details please visit <http://fairroot.gsi.de/>

Florian

Subject: Re: New external package release sep12 (GEANE patch)  
Posted by [Lia Lavezzi](#) on Fri, 07 Sep 2012 09:06:46 GMT  
[View Forum Message](#) <> [Reply to Message](#)

---

Hi pandarooters,

in the sep12 release of the external packages a patch has been applied to GEANE (as written by Florian on <http://fairroot.gsi.de/>).

Just a few remarks on the patch: it contains the following two improvements in the routine which handles the propagation to the point of closest approach.

Change 1, in the actual poca finding procedure piece of code:

- PREVIOUSLY: an extrapolation to a very large track length was performed and, during the propagation, the poca was found, BUT the extrapolation was not stopped and used to go on till the final track length was reached;
- NOW: the particle is stopped after finding the point of closest approach;

Change 2, in the propagation type handling:

- PREVIOUSLY: the poca finding procedure was performed also when propagating to the plane after having found the poca, due to a missing reset of a variable;
- NOW: the poca finding procedure is accessed only when requested.

These two changes improve the time performances of the extrapolation and thus of the Kalman filter. We tested the macro/pid/run\_reco\_sttcombi.C on 1000 events without and with the patch and the kalman time is roughly halved.

The changes are still inside a "patch" since we would like some massive testing before inserting them as "official". For this reason, if you notice any strange behaviour in the propagation and/or in the reconstruction results, please let us know!

Have fun,  
Lia and Alberto.

[View Forum Message](#) <> [Reply to Message](#)

Dear experts,

I'm trying to build the new external packages (Sep 12), but the build stops with the following error:

```
*** Compiling root .....
Copied rootconfig.sh .....
Configure Root .....
linuxx8664gcc
./rootconfig.sh: line 27: [: too many arguments
Checking for source directory ... /home/fairroot/fairsoft_sep12/tools/root

INFO: --enable-xml: already enabled by default.
Checking for GNU Make version >= 3.80 ... ok
Checking for C compiler ... gcc
Checking for C++ compiler ... g++
Checking for linker (LD) ... g++
Checking for F77 compiler ... gfortran
Checking for libX11 ... no
configure: libX11 MUST be installed
See http://root.cern.ch/drupal/content/build-prerequisites
Makefile:20: config/Makefile.config: No such file or directory
Makefile:29: config/Makefile.comp: No such file or directory
Makefile:40: *** Please run ./configure first. Stop.
Makefile:20: config/Makefile.config: No such file or directory
```

```
Makefile:29: config/Makefile.comp: No such file or directory
Makefile:40: *** Please run ./configure first. Stop.
**** Checking libraries in /home/fairroot/build_FairSoft_Sep12//lib ****
*** ERROR: root could not be created.
*** End installation of external packages with Errors***
```

I'm using Debian wheezy with gcc version 4.7.1,  
If I run the installation script on a 32 bit pc with the same OS and configuration, then everything goes fine. For the previous release of the external packages on the same system I did not have any problem at all.  
Anyone any idea how to solve this?

Regards,

Dear Mr. Babai,

the error message shows that libX11 wasn't found:

```
# Checking for libX11 ... no
# configure: libX11 MUST be installed
```

Did you check that libX11 and libX11-devel are installed and 32bit?  
Did the check or requirements for this library change?

Cheers,  
Mathias

Dear Mathias,

Thank you for your reply.

Actually they are there. As the previous version of the external packages (jan12) did not complain on those and I could install it without any problem.

I think something is changed in the root build scripts, but I do not know what and the most important thing is how to fix or bypass this, .

Regards,  
Mohammad.

Hi Mohammad,

can you please check where the X11 library and the corresponding headers are installed. Maybe Debian is now as good as Ubuntu, shifting the libraries or headers to a directory which is not in the default search path of root.

Ciao

Florian

---

Hi Florian,

The headers are in:

`/usr/include/X11`

and libs in:

`/usr/lib/x86_64-linux-gnu/`

I will directly check how it is set in the build scripts.

Ciao

Mohammad.

Hi Mohammad,

could you please try adding the following line

`--with-libx11-libdir=/usr/lib/x86_64-linux-gnu/`

in the file "tools/rootconfig.sh" where all the other flags are set and run the configure.sh script again.

Ciao

Florian

Hi Florian,

I had to add the following lines to the script you have mentioned and everything seemed to go OK. But at the end building fairbase and r3broot failed. With a message like "Could not open file TEveEventManager.h". The actual header was not included in the installation directory. So, now I have checked out a clean root again and waiting to see if will work this time.

```
--with-x11-libdir=/usr/lib/x86_64-linux-gnu\  
--with-xpm-libdir=/usr/lib/x86_64-linux-gnu\  
--with-xft-libdir=/usr/lib/x86_64-linux-gnu\  
--with-xext-libdir=/usr/lib/x86_64-linux-gnu\  

```

Regards,  
MB.

Hi Florian,

After applying the changes and a full recompile, the error remains the same. So I think the root build is missing some components. Maybe OpenGL is the problem. It remains strange as it goes fine on a 32 bit PC with exactly the same software installed, .

```

Hi Mohammad,

probably you have to define also where to find the OpenGL libraries and headers

```
--with-opengl-libdir=???  
--with-opengl-incdir=???
```

Ciao

Florian

Hi Florian,

I give up, . Whatever I include, enable or disable the root configure script produces the same.  
Comparing the 32 and 64 bit configurations I found the following:

32:

Result: Enabled support for asimage, astiff, builtin\_afterimage, builtin\_ftgl, builtin\_glew,  
builtin\_lzma, explicitlink, fftw3, gdml, genvector, krb5, mathmore, memstat, minuit2, monalisa,

opengl, pythia6, pythia8, roofit, shadowpw, shared, soversion, ssl, tmva, x11, xft.

64:

Enabled support for asimage, astiff, builtin\_afterimage, builtin\_ftgl, builtin\_zlib, builtin\_lzma, explicitlink, gdml, genvector, mathmore, memstat, minuit2, shadowpw, shared, soversion, tmva, x11, xft.

This does not even change if I explicitly run configure from root itself on the command line and specify the include and library directories. Very strange.

Last thing I can do, as a test, is to modify the configure script packed with root itself to see if that might help. A lot of work but maybe solves the problem.

Regards,  
Mohammad.

Hi Mohammad,

do you have OpenGL installed? Unfortunately I have no Debian Squeeze machine to test and only can guess, so I am not of much help here.

Ciao

[View Forum Message](#) <> [Reply to Message](#)

Hi Florian,

Yes everything is there. The headers and libs.

If I have a look on the same machine but in the previous external packages (jan 2012), then all of the parameters are fine. ROOT was compiled correctly and the options were all OK. So I think that the configure scripts for the current ROOT release is changed. So I will try to fix this and will send you the solution or at least a description of that. I think we need to solve this, because for the next debian stable release we will hit this problem again.

It seems to work. I have added the paths to the root configure script and it went all OK. So these two paths:

/usr/lib/x86\_64-linux-gnu  
/usr/include/GL

In the case of 32 bit machines the root script can find the correct path (/usr/lib/i386-linux-gnu/) but one way or the other it can not handle the 64 bit case.

Regards,  
MB

Hi,

I tried to compile it. It seems to freeze with

Checking for GNU Make:  
/usr/bin/which: no dpkg-architecture in  
(/home/promme/bin/fairsoft/tools/root/bin:/usr/local/bin:/usr/bin:/bin:/usr/local/sbin:/usr/sbin:/sbin:/home/promme/bin:/home/promme/bin/fairsoft/transport/geant4/bin:/home/promme/bin:/home/promme/bin/pandaroot/./buildPanda/bin:/home/promme/bin/fairsoft/tools/root/bin:/home/promme/bin/rootpwa/trunk/build/bin)

I'm using:

```
g++ --version  
g++ (GCC) 4.6.1 20110908 (Red Hat 4.6.1-9)
```

Or shall I wait longer than 30 min. Inet traffic seems to be low (no file transfer) and CPU is also sleeping.
