Hi All

I have two issues that i want to discuss here.

1) I just updated fairroot to version 17104 and tried to build it and it failed with the following errors.

```
raghav:build raghav$ make
--- Found a Mac OS X System 10.7
--- Found GNU compiler collection
--- Build Type: RelWithDebInfo
--- Compiler Flags: -m64

not

```
    found
#   include <TargetConditionals.h>
    ^
1 error generated.
make[2]: *** [fairtools/CMakeFiles/FairTools.dir/FairLogger.cxx.o] Error 1
make[1]: *** [fairtools/CMakeFiles/FairTools.dir/all] Error 2
make: *** [all] Error 2
raghav:build raghav$
```

I tried searching my computer for such a file TargetConditionals.h and i could not find it. I have never had this problem before.

This actually happened suddenly as it was working till noon today and i tried to create a new library for my fastjet analysis and even though i did not change anything, it stopped working (as in make did not go through completely) . So i thought that updating it would work. Therefore i went ahead and did an update on fairsoft as well and this is what i got

```
fairsoft svn update: 17104
raghav:fairsoft raghav$ cd build/
raghav:build raghav$ make
--- Found a Mac OS X System 10.7
--- Found GNU compiler collection

  Unknown CMake command "GENERATE_LIBRARY".
```

```
-- Configuring incomplete, errors occurred!
make: *** [cmake_check_build_system] Error 1
```

2) I am also uploading the CMakeLists.txt file for my new library and i want to know if it is the correct format, because i only have header files which contain the classes and necessary methods and not .cxx files like all my other libraries have.

It is to do fastJet clustering algorithms. It is basically from the <http://fastjet.fr/> and i am trying to implement it inside fairroot so that it will be easy for me to do analysis in one step.

Any help is hugely appreciated.  
Thanks a lot.  
Raghav

Hi, everyone!

I've got some problems with installation CBMROOT. I dowloaded external packages of FairSoft(mar15) and installed FairRoot(<https://github.com/FairRootGroup/FairRoot> "Step by step installation").

So, in file ".bash.rc" are written the last 3 strings as you can see:

```
export SIMPATH=~/.fair_install/FairSoftInst
export FAIRROOTPATH=~/.fair_install/FairRootInst
source /home/borys/fair_install/FairRoot/build/config.sh
and FairRoot works fine.
```

But then I dowloaded release version(jun15) of CBMROOT from <https://subversion.gsi.de/cbmsoft/cbmroot/release/JUN15/> using :

```
borys@borys-Aspire-V3-571G:~$ svn co
https://subversion.gsi.de/cbmsoft/cbmroot/release/JUN15/ cbmroot
```

.....

```
A cbmroot/fles/spadic/message/wrap/cpp/demo/SConstruct
A cbmroot/fles/spadic/message/wrap/cpp/demo/demo.cpp
Checked out external at revision 763.
```

Checked out revision 8015.

```
borys@borys-Aspire-V3-571G:~$ cd cbmroot/
borys@borys-Aspire-V3-571G:~/cbmroot$ mkdir cbm_build
borys@borys-Aspire-V3-571G:~/cbmroot$ cd cbm_build/
borys@borys-Aspire-V3-571G:~/cbmroot/cbm_build$ cmake ..

-- Configuring incomplete, errors occurred!  
See also "/home/borys/cbmroot/cbm\_build/CMakeFiles/CMakeOutput.log".  
I also tried to write in .bash.rc  
export SIMPATH=/misc/cbmsoft/Lenny32/jun15  
but problem didn't disappear.  
What am I doing wrong?  
Thanks for any help!
