Dear colleagues,

I have a problem with installation of external packages on my PC under Ubuntu.

With version may18 the problem is the next:

-----  
Compiling '/home/pjiang/install/fairsoft\_may18/transport/geant4/build\_g4py/site-modules/python/\_\_init\_\_.py'...

[ 71%] Built target test07  
[ 73%] Built target test06  
[ 74%] Built target test09  
[ 75%] Built target test10  
[ 76%] Built target test08  
[ 76%] Built target g4py\_module  
[ 76%] Built target test11  
[ 78%] Built target test13  
[ 78%] Built target test12  
[ 82%] Built target gtest01  
[100%] Built target pyG4geometry

Install the project...

-----

What could be the reason? What to do?

Thank you in advance,

Peiyong

I just downgrade my linux kernel and my gcc version, and the problem is gone.

Dear Peiyong,

good that the problem is fixed. Could you please specify which kernel and gcc version you have used which failed and which one is working now?

Cheers,

Tobias

Hi Tobias,

At first I installed it on linux mint 19.1(ubuntu LTS 18.04),I upgraded my system before, and I forgot the specific kernel version. The gcc was about 7.2. Under this situation, there was a folder in `~/python3/` named `__pycache__` inside which there were pairs of files: `*.cpython-36.opt-1.pyc` and `*.cpython-36.pyc`. I think these should be `*.pyo` and `*.pyc`. So I change the name and put it in the folder `~/python3/`. It works. My final aim is the installation of PandaRoot, but I was failed there.

Another reason I wanted to downgrade my linux mint is that I met a problem in the installation of Pandaroot. The problem is :  
"nvcc fatal:Value 'sm\_21' is nor defined for option 'gpu-architecture'." At that time, my nvcc was latest one(I think it is 10) which does not support "sm\_21" any more. I just looked up the word 'sm\_21' and removed "--gpu-architecture sm\_21;" from "(APPEND CUDA\_NVCC\_FLAGS --gpu-architecture sm\_21;-std=c++11;-O2;-DVERBOSE)", and it continued. But finally the PandaRoot was not installed successfully.

Then I made a decision to reinstall my linux mint after I checked the kernel version and gcc version of kronos. I tried linux mint 17.3 (ubuntu LTS 14.04 ?) but it is too old to install the drivers for the new pc. so I changed to linux mint 18.3(ubuntu LTS 16.04). The information:

1.  
system: linux mint 18.3  
gcc version 5.4.0 20160609 (Ubuntu 5.4.0-6ubuntu1~16.04.11)
2.  
Linux pjiang 4.14.10-041410-generic #201712291810 SMP Fri Dec 29 18:11:20 UTC 2017  
x86\_64 x86\_64 x86\_64 GNU/Linux
3.  
nvcc: NVIDIA (R) Cuda compiler driver  
Copyright (c) 2005-2015 NVIDIA Corporation  
Built on Tue\_Aug\_11\_14:27:32\_CDT\_2015  
Cuda compilation tools, release 7.5, V7.5.17

Under this situation, everything goes FINE until the last step in the installation of PandaRoot. The new problem in the installation of Pandaroot is as follows. And I have totally no idea to solve it. Do you have any recommendation?

```

For me it seems that you have a problem with the CUDA installation of the  
PndSttCellTrackFinder.  
This part of the code is not really needed and one could try to just comment the compilation  
out.

Therefore you have to modify the tracking/SttCellTrackFinder/CMakeLists.txt file.  
Comment out lines 35,36,37 (adding the CUDA directory to the build process) and  
line 97.

I cannot check this patch because I do not have a NVIDIA graphics card in my system, but I  
hope that it works.

Cheers,

Tobias

Hi Tobias,  
It means that if I block the nvidia card from BOIS, then cmake ../ to get a new makefile, the  
problem would be avoided?  
I will try, and I will leave a message here to you for explaining the progress regardless of  
whether I am successful or not.  
Best,  
Peiyong

Hi Tobias,  
I would like to let you know that I am successful to install PandaRoot on linux mint 18.3.  
I did not block the NVIDIA card from the bois. I just remove cuda to let the pandaroot not find  
the cuda and gpu. I did it before but I was failed. The right steps are : 1. remove cuda. 2.  
remove buildPanda folder and mkdir buildPanda then cd buildPanda 3. cmake ../ 4. make (I did  
try "make -j4".) The reason I was failed before is that I did not item 2.  
And It seems that it may be successful to install on linux mint 19.1(latest linux mint.)  
Thank you again!  
Best,  
Peiyong

You do not have to block the card in the BIOS. It is sufficient to comment it out in the CMAKE.

Cheers,

Tobias
