View Forum Message <> Reply to Message

Hi!

I tried to simulate lambdas (generated with EvtGen) and I get the following error. Any idea?

Program received signal SIGFPE, Arithmetic exception.
[Switching to Thread -1235704640 (LWP 29419)]

Why do you use geant4?

Subject: Re: Geant4 floating point exception

View Forum Message <> Reply to Message

Hi Sebastian,
i have actually the same problem.
It seems that there is some problem with the geant4 physics
process. Try to run with the geant3. it works.

cheers alicia.

Subject: Re: Geant4 floating point exception

View Forum Message <> Reply to Message

yes it is known that geant4 doesn't work properly here, but
that is not excuse to exclude it from the software.

I think this problem should anyway be solved, so we can work
with both, geant3 and geant4.

Alicia.

Hi

This is a bug already reported by Alicia. The problem is that the
bug is not in our code.
I will try to locate the bug and send a bug report to the GEANT4
team. Maybe there is a workaround but it is always hard to change something in the transport,
because you can easily introduce a lot of errors by your changes.

Ciao

Florian

Hi!

I do not want to start a discussion wether G3 or G4 should be used. We want to have both, so
we have to make it to work.
However I am (sort of) glad that I am not the only one who has that problem!

CU! Sebastian.

The point of my answer (but not written) was:

Our VirtualMC has problems with G4 lists, the only persons that can change the code are from outside the collaboration, so we cannot operate in this sense, just report to them and wait (and this was done).

And in our external packages the data directories where completely missing, and we do not know how it affects our data.

Meanwhile there are two new versions of virtualMC, that require new external packages (such as geant4 9.0), so in some sense our code for g4 is obsolete. The update takes some time and it is not already planned, because it requires some tests.

So with our release it is better to use only G3, at the moment. This will changed hopefully in the next future, but it does not depend only from us. We are the only hep experiment which is using the virtualMC geant4, so we are the "beta tester".

Hi!

The error message I posted has nothing to do with the VMC interface (at least I would be extremely surprised) When you look into the respective G4 class you will notice, that there are simply a lot of divisions where there is no check for division by 0. I guess that is where the problem comes in.

I have done all studies so far with G4, so I do not see why it should be impossible. Furthermore the complete code is in our hands. If the community is not fast enough we have to look ourselves. At least try to.
I guess that there are people in Panda that are adept enough to debug G4!?

Regards, Sebastian.

This is true, but it is always not easy to change parts of the
simulation code because you never can know what are the side
effects. You need at least a litle bit of overview.
For example in your case there are a lot of pssible divisions by zero. The problem is now what to do in such a case. If i set
the variable to some value i have to understand what could be the effect of that change.

Ciao

View Forum Message <> Reply to Message

Hi!

ok, I put some assertions into G4 and indeed it is a division by 0 bug. I'll have a look at this and try to understand
a) how this can happen at all
b) how to do a fix

>>> Event 83
root.exe: src/G4UrbanMscModel.cc:913: G4double
G4UrbanMscModel::SampleCosineTheta(double, double): Assertion `tau!=0' failed.

CU! Sebastian.

hi, i'm still having problems to connect.
From my side,
i wanted to say that the tracking and identification of low kaons seems to be feasible for the tpc and the tof detector.

Unfortunaly i can not extract the reconstructed information from the tpc
because Sebastian is still working on.

I have extracted the moementum and the length of the trayectory by myself(helix parametrization ,of course it is an ideal case).
But i will wait till the tpc is able to produce some information from the tracking, to study what is the expected resolution for the low kaon identification(tof).

Here attached i send you some moemnta distributions

in which kaons and the pions distributions (coming from antiXi- annihilation) are plotted. thetPK.eps(kaonon P vs polar angle) and thetPP.eps(pion P vs polar angle)

The only requirement which has to be filled by them, is that both particles have to have a transversal moemnta larger than 300 MeV in order to reach the tof detector + tpc region. The tranversal moemntum distribution of both particles are plotted also together.See ptKP.eps

I'm still working on the Secondary target(silicon strips) and on the HPGE cluster detector digitization.

I want also in the next weeks to finish the implementation
of the Hypernuclei generator, and maybe to start to work on the reconstruction.

I will commit as soon as possible the tof detector.

OK, i hope that can be helpful.

cheers ALicia.

In each case our g4 code (8.2) is not the latest one,
the last is 9.0.
So one should check if this was corrected in the new release.

Hi Sebastian

I also check G4 9.0. There are indeed some changes in G4UrbanMscModel.cc, even one concerning the SampleTheta function.
In a first try i only backportet this changes, but this doesn't help. I still get the same error.
I will now install G4 9.0 here at GSI and try to run with the new
version.

Ciao

Florian

Hi florian!

I came to the samer conclusion concerning the UrbanMsc.
I tried to just run G4 4.9 yesterday, but somehow the libraries seemed to have changed. I got some dynamic link problems.

Then I looked a little bit closer to the UrbanMsc and I found out that the error occurs when

a) the steplength is smaller than stepmin (in ComputeGeomPathLength)

and

b) the steplength is larger than 0.05*currrentRange (in SampleCosineTheta)

This surely appears to be an exotic case, but it leads to an inconsistency in the calculation of tau which culminates in a division by zero.

I have to admit that I can only guess what all the variables mean. So at the moment I have to think about what would be a reasonable fix.

Cheers! Sebastian.

Hi Alicia

Please use

  export SIMPATH=/misc/cbmsoft/Debian3.1/new

and go on.
I am installing at /misc/cbmsoft/Debian3.1/debug the newest GEANT4 version. That's why you can't find the file.

Ciao

Florian

Yes fine,
but maybe the next time
is it better to inform previosly when you attend to change somethimg which can influence the
ongoing work of the rest of the people using the gsi installation.

cheers Alicia.

Hi Alicia

This is my private working directory which was not intended to
be used in a normal all day use. This directory should only be used if you have problems and
want really to know where your program crashes in our external packages.

So please use normaly the SIMPATH set to

   /misc/cbmsoft/Debian3.1/new

which are exactly the same packages but without debug information.

Ciao

Florian

Hi

Yes you have to.

I checked and there was a small problem in one of the cmake files. Please run an svn update in

pandaroot/cmake/modules and run cmake again. Then everything
should be fine.

Hi Sebastian

> I tried to just run G4 4.9 yesterday, but somehow the
> libraries seemed to have changed. I got some dynamic link
> problems.

This can be solved in changing the order of the libraries in gconfig/g4libs.
The real problem is that geant4 don't run with root 5.14.00 but
needs root 5.16.00 which envorces big changes in the framework.
So the step to geant4 9.0 is not easy to make.

> Then I looked a little bit closer to the UrbanMsc and I found > out that the error occurs when

> a) the steplength is smaller than stepmin (in
> ComputeGeomPathLength)

> and

> b) the steplength is larger than 0.05*currrentRange (in
> SampleCosineTheta)

I will try to ask the GEANT4 people for advice.

Ciao

Florian
