Dear all, i would like to know

which method of VMC can i use to kill a certain particle and its secondaries?

cheers ALicia.

Hi Alicia,

in TVirtualMC there are the following functions:

virtual void StopEvent()

virtual void StopRun()

virtual void StopTrack()

In theory they should do the job. So in your ProcessHits you should write:

gMC->StopTrack()

I think. Try and let me know if it works or not.

Hi,

StopTrack() will stop the track immediatly, and will not transport it further. Anyway secondaries already produced before stopping the track (are on the stack) will not be killed, they will be processed further. Do you need to kill these too ?

Mohammad

Yes, but only the secondaries related to the particle
i want to kill.

I would like to be able to use the same functionality i get with killSecondaries of geant4.

thanks a lot
alicia.

Hi again, maybe i should be more clear.

I create a Xi minus, which penetrates the volume
ionizes creating electrons, muons..(secondaries allowed)

but when the xi minus stops, i add its information to the hit collection, and then after that i want
to kill the xi minus if it still alive, and its decay products.

So that was(is still) managed by geant4, by asking which secondaries were created, and if they
were secondaries coming from the decay of xi minus, then, the KillTrackandSecondaries was
called.

cheers Alicia.
