Subject: Compilation problems with DpmEvtGen  
Posted by [Ralf Kliemt](#) on Wed, 16 Apr 2008 09:11:20 GMT  
[View Forum Message](#) <> [Reply to Message](#)

---

Hi all,

The dashboard website is offline....

I have problems with compiling DpmEvtGen. I get many warnings like  
In file /home/ralfk/Pandaroot/Dart-src/pgenerators/DpmEvtGen/init.f:619

```
*8HXU++GA ,8HXD+GAM ,8HXS+GAM ,8HA+AKPI ,8HT02PI+ ,8HC1++2K ,  
1
```

Warning: Extension: Conversion from HOLLERITH to REAL(8) at (1)

And then at the end there is probably the serious message:

```
/home/ralfk/Pandaroot/Dart-src/pgenerators/DpmEvtGen/main.cc:26: warning: non-local  
variable '<anonymous struct> lujets_' uses anonymous type  
Linking CXX executable DPMGen  
CMakeFiles/DpmEvtGen_exe.dir/main.o: In function `main':  
/home/ralfk/Pandaroot/Dart-src/pgenerators/DpmEvtGen/main.cc:112: undefined reference to  
`dpm_gen__'  
collect2: ld returned 1 exit status
```

My Workaround: I keep the pandaroot/pgenerators directory and pandaroot/CMakeLists.txt  
before rev.2525.

Kind regards, Ralf.

Hi Ralf

The warnings you can forget about.

The problem about the "undefined reference to `dpm\_gen\_\_'"  
i know from Mac OS X.

Which compiler do you use on your computer g77 or gfortran?

Ciao

Florian

Quote: The warnings you can forget about.

Well, when I compile DPM "stand-alone" I have only one warning message.

Quote: The problem about the "undefined reference to `dpm\_gen\_\_'"  
i know from Mac OS X.

Which compiler do you use on your computer g77 or gfortran?

In my system I have both g77 and gfortran. In general, when I compile DPM "stand-alone", it  
uses g77. Now I don't know which compiler is it taking.

Hi Stefano

I thought the problem is related to Mac OS X, but now it looks more like a problem with  
gfortran.

Can you try to compile the standalone version with gfortran.

I am nearly shure that you will see all the warnings and you will  
crash in the end.

Ciao

Florian

You are right,  
I have changed the file common.mk using "gfortran" instead of "g77" and I have the same behaviour.

Maybe with cmake we should fix that only "g77" is used, if present.

Hi Ralf, hi Stefano

I think i solved the problem. For me it compiles now with g77 and gfortran. Please update to rev 2540 and try again.

Ciao

Florian

Hi,

I have removed everything (rm -rf pandaroot/ cbuid/) and restarted from the checkout, and I have still the same error message after the "make install" (the simple "make" gives only the warning):

[View Forum Message](#) <> [Reply to Message](#)

---

I repeat,  
I have checked out the code entirely from svn and recompiled pandaroot from scratch. So my CMakeLists.txt is the most updated.

I did a: "grep -r CBM\_LIBRARY\_PROPERTIES \*" but I did not find this string in the whole pandaroot and cbuilder directory.  
Where should it be set?

[View Forum Message](#) <> [Reply to Message](#)

---

Hi Stefano

Here I wonder. I looked into my CMakeLists.txt and there are the following lines

```
# Set the library version in the main CMakeLists.txt
SET(CBMROOT_MAJOR_VERSION 0)
SET(CBMROOT_MINOR_VERSION 0)
SET(CBMROOT_PATCH_VERSION 0)
SET(CBMROOT_VERSION
```

```
"${CBMROOT_MAJOR_VERSION}.${CBMROOT_MINOR_VERSION}.${CBMROOT_PATCH_VERSION}
SET(CBMROOT_LIBRARY_PROPERTIES ${CBMROOT_LIBRARY_PROPERTIES}
    VERSION "${CBMROOT_VERSION}"
    SOVERSION "${CBMROOT_MAJOR_VERSION}"
    SUFFIX ".so"
)
```

which came in with revision 890 from 06/14/07.

Can you check again??

Ciao

Florian

[View Forum Message](#) <> [Reply to Message](#)

---

Ah ok,  
it was CBMROOT\_LIBRARY\_PROPERTIES, not CBM\_LIBRARY\_PROPERTIES. This I have:

```
# Set the library version in the main CMakeLists.txt
SET(CBMROOT_MAJOR_VERSION 0)
SET(CBMROOT_MINOR_VERSION 0)
SET(CBMROOT_PATCH_VERSION 0)
SET(CBMROOT_VERSION "
${CBMROOT_MAJOR_VERSION}.${CBMROOT_MINOR_VERSION}.${CBMROOT_PATCH_
VERSIO N} ")
SET(CBMROOT_LIBRARY_PROPERTIES ${CBMROOT_LIBRARY_PROPERTIES}
    VERSION "${CBMROOT_VERSION}"
    SOVERSION "${CBMROOT_MAJOR_VERSION}"
    SUFFIX ".so"
)
```

---

Hi Stefano

How did you do the installation? Did you only use CMake or did you use somehow the Makefile in DpmEvtGen?  
I cannot reproduce your problem on any of my machines so it's hard to come up with a good answer.

What you can do as workaround is to exclude DpmEvtGen from the list of directories and to copy the library to the lib directory.

Ciao

Florian

[View Forum Message](#) <> [Reply to Message](#)

---

I have tried to "make" with and without compilation of pgenerators/DpmEvtGen, but without any succes.

I have bypassed the problem with a simple trick:

```
spataro@cca04
/home/spataro/test/cbuild/pgenerators/DpmEvtGen/CMakeFiles/CMakeRelink.d ir $ mv
libDpmEvtGen.so libDpmEvtGen.so.0.0.0
```

In this case the make install works (hopefully even the code).

Hi,

I have the same problem like Stefano, that I do not have libGen.so.0.0.0, only I have libGen.so

```
-- Installing /home/biegun/PANDA/fair/pandaroot.dart/buildDart/lib/libGen.so.0.0.0
-- Installing /home/biegun/PANDA/fair/pandaroot.dart/buildDart/lib/libPGen.so.0.0.0
CMake Error: Error in cmake code at
/home/biegun/PANDA/fair/pandaroot.dart/buildDart/pgenerators/DpmEvtGen/c
make_install.cmake:30:
FILE INSTALL cannot find "
/home/biegun/PANDA/fair/pandaroot.dart/buildDart/pgenerators/DpmEvtGen/C
MakeFiles/CMakeRelink.dir/libDpmEvtGen.so.0.0.0 " to install.
```

Current CMake stack:

/home/biegun/PANDA/fair/pandaroot.dart/buildDart/cmake\_install.cmake;/home/biegun/PANDA/fair/pandaroot.dart/buildDart/pgenerators/DpmEvtGen/cmake\_install.cmake

when I changed the name of the library libDpmEvtGen.so into libDpmEvtGen.so.0.0.0 (like Stefano did) installation of libraries finished successfully.

After that, I run Dashboard script Dart.sh Experimental , and if someone could look at it there is 2 times kviq41.kvi.nl - one seems to be ok, but the second one looks 'empty' (no time, no tests passed). This 'empty' case is also for Nightly run of Dart.sh script.

Because pandaroot does not compile automatically for me (actually it compiles, libraries are linked but the error is during installation of libraries) and I had to change by hand name of the libDpmEvtGen.so into libDpmEvtGen.so.0.0.0 library, I thought that maybe the 'empty' case for my computer at Dashboard (kviq41.kvi.nl) appeared.

Am I right or it's something else?

Is there any solution for installing libDpmEvtGen.so.0.0.0 automatically?

Cheers,  
Ola.

Hi

With help of Stefano, allowing me to play with his computer, I found the problem. His version of cmake (2.4.3.) was too old. The support for Fortran in cmake is rather new and there were many changes in recent versions. It looks like the support for library versioning was introduced after cmake 2.4.3. The solution of the problem is to update your cmake to a newer version. The latest release is 2.4.8 which works without any problems. Also cmake 2.4.7 is fine. If other versions between 2.4.3 and 2.4.7 work I cannot test.

Ciao

---

Subject: Re: Compilation problems with DpmEvtGen  
Posted by [Aleksandra Biegun](#) on Mon, 28 Apr 2008 23:40:01 GMT

Hi Florian!

Thanks a lot for that message.

I had cmake version 2.4.3. and now, from the latest external package from 14.03.08 (fairsoft) I have 2.4.7 (not 2.4.8 as you claim)

<http://fairroot.gsi.de/installation/External%20Packages.htm>

Anyway, it seems to work, let's see tomorrow.

Ciao,  
Ola.

[View Forum Message](#) <> [Reply to Message](#)

---

Hi Tobias

As i can see you're using ifort. There the problem comes in, because ifort don't know the flag -fsecond-underscore. Somehow different compilers (g77, gfortran) somehow create different names in the library dpm\_gen\_ vs. dpm\_gen\_\_ . For g77 and gfortran this can be adjusted with the above flag.

I have to look for the right flag and change the CMakeLists.txt.

I assume ifort creates dpm\_gen\_ which you can check with

```
nm libDpmEvtGen.so | grep dpm_gen
```

I will look for that problem if i can connect again to GSI.

Ciao

Hello everybody!

I solved the problem with the DpmEvtGen compilation just by removing the second underscore at the end of the dpm\_gen\_ function name in the main.cc file. After that it compiles and links without problems. I am wonder why do we need this second underscore at all?

Andrey

---

Subject: Re: Compilation problems with DpmEvtGen

[View Forum Message](#) <> [Reply to Message](#)

---

Hi Andrey

Because some other compiler decorate it with a second underscore.

So the name in the library is compiler specific. So your change will not work with another compiler.

To overcome this the CMakeLists.txt was changed and up to now it worked with all compilers i tested. There is still a change i have to commit which is needed if you use ifort, but beside of that it works with all tested compilers. I committed

this one minute ago

Which compiler do you use? Please test if this CMakeLists.txt works for you. If not please let me know.
