Dear all,

in svn you can find the new release of the muon detector, developed together with George, according to our current solenoid design.

The package is now called "MDT" instead of MUO, such as "Muon Detector Tracker" (the original name).

A ideal digitization is also provided.

The macros were added also in svn, and the global macro/run_ macros were also updated. Please remember that libMuo does not exist anymore, but now you have to use libMdt.

Here you are our new sketch (I have no idea on why I am having problems with the Microvertex, maybe it is due to the old geometry).

Bye

Dear Stefano,

the problem with the MVD is very simple. You have to set the VisLevel to a value larger than ten. The MVD is based on a very structured design with many subgroups. Therefore the standard VisLevel of 3 is insufficient.

Cheers,

Tobias

MCpoints & volumes are correct. The message will be removed with my next commit.
Thanks for finding.

Ciao, Ralf.

For all those who have problems with Dashboard,
the file Dart.sh was modified to set correctly the name of the muon library (muo->mdt).

So you should download the last version of Dash.sh, set your environment and everything will
work again (hopefully).
