Dear genfiters,

when testing genfit on dch hits I noticed that memory consumption grows steadily with the number of analysed events. In a fast check on stt data I observed the same behaviour, that's why I think it might be a problem in genfit itself (memory leak?). Can anyone have a look?

cheers,
ola

Hi Ola,
Actually i have the same problem as you have now.
I solved(at the moment works) by doing the following

In the directory of genfit
if you go to the class Track.cxx
at the line 26
add the line
delete trackReps

```
Track::~~Track() {  
22  if(trackReps!=NULL){  
23    for(int i=0;i<getNumReps();i++) {  
24      delete trackReps->At(i);  
25    }  
26  delete trackReps;  }  
27  for(unsigned int i=0;i<hits.size();i++) {  
28    delete hits[i];  
29  }  
30 }
```

if you have a task to extract the information
from the track object,
PNDDchKalmanQATask for example

at line 150 add also fTrackarray->Delete();

i hope it works

best regards
Alicia S.
