Hi,

I try to install the external packages on a Thinkpad X220 amd64
with Debian Wheezy and get only to the infamous vgm.

At the end is the output of the log file and the partly output
on the screen.

Any ideas?

Best regards
Carsten

```
-----  
*** Compiling Clhep .....

```

On the screen there is a error message in geant4:

Hallo Carsten,

Debian Wheezy is still not released and still has thousands of bugs, it is expected to be released end of this year. I found some bug reports about the same problem you have here with Geant4 (I could reproduce it also on a virtual machine).

So I am sorry about this, but we cannot fix this now, first it is not in our code and second it is still changing every day, they just switch to gcc 4.7 and many things are still missing!

Why you need this Wheezy? cannot you use Ubuntu 12.04?

regards

Mohammad
