
Subject: [FIXED] Beam pipe valves?

Dear all,
today I plotted the PANDA geometry and I have seen something strange:

In the OGL drawing you can see that the pipe has a sort of "tower" which is in the middle of the muon filter. I am wondering what is wrong there, if the "tower" should be really there, if maybe the muon filter should be modified to host it, or if maybe we have some geometry problems.

Waiting for the experts' comments...

Indeed, this is the first pumping station downstream of the target. The description corresponds to what is to be found on EDMS since several years. So I guess that muon description is not up to date?

Fixed!

Please update your mdt folder, in particular those running analysis on forward tracker.
