Dear all,
the new APR13 pandaroot release has been created by Johan, based on the trunk 19465.

You can download it with the following:

svn co https://subversion.gsi.de/fairroot/pandaroot/release/apr13

and after follow the usual installation procedure. This is working with sep12 external packages, but it should work also with apr13.

Let me stress that after there will be major changes and the trunk will be unstable for several weeks. If you plan to run analysis please use this release and not the trunk.

If you have any problems or find some bus please report them.

Hi all,
I have updated the emc parameters and the Geane.C in order to solve problems that arose in the release.
Please update your apr13.

I have updated mdt package, because of a bug in the hybrid muon tracking. Please update your apr13 release.
