Dear Dima, All,

In last collaboration meeting, I understood some parameters used in current simulation are not consistent with testing results of hardware setup, say the width and shape of barrel readout waveform, the Shashylik readout, some sampling rates etc., I try update the simulation parameters setup to the latest hardware testing, now I have got forward waveform data results from KVI, how can I get the others? Who should I contact? these parameters are crucial for time-based simulation. Thanks for your help.

Hi,

is there a presentation showing such discrepancy? I heard that there is a mismatch in resolution, but I have never seen a plot.

Unfortunately the EMC talk are not in Indico.
