The GammaWare could be installed on different machine using cmake.
It relies on ROOT installed on the system.

The recipe to install it could be found in the Cookbook and a full User's Guide is accessible

In Principle the GammaWare is now compatible with ROOT6.
If it does not work, it might be required to add the -Dcxx11=ON option once calling cmake.

It has been tested on
MAC OSX 10.8.5 and 10.10.1 with clang compiler
Linux Unbuntu with gcc 4.8.2 and 4.9.2

Cheers
Olivier

Hi Olivier,

I saw this post now.

I indeed have a problem with the link you posted.
It seems that the document does not exist...

Cheers,
Damian

Hi Jeremie,

Same error as before:

You don't have the necessary permission to do the requested action.

You don't have sufficient rights to perform this operation

For information, I get this message only when I am log-in the atrium (with CNRS certificate). I tried after being logout... and I can see the document and open it.
