
Subject: Compilation fails

I am working to set up the realistic background simulations for the VETO. For that I wanted to have the newest update of R3Broot, but it refuses to compile. During compilation R3Broot wants to have a file called FairDbReader.h which is supposed to be located in FairRoot_Install/include/ but this file simply does not exist anywhere in FairRoot. After I re-installed the newest download of FairRoot the problem is not solved (I did not re-install FairSoft).

The files that require this header are /r3broot/r3bdb/landdb/R3BLandTCalPar.h, /r3broot/r3bdb/landdb/R3BLandTCalPar.cxx and /r3broot/r3bdb/landdb/R3BLandLinkDef.h

Am I doing something wrong? Or is there a bug?

Then there are also 2 other things that occur during compilation. The first is that /r3broot/CMakeLists.txt wants to have packages like GEANT3, GEANT4, GEANT4VMC, etc and normally it cannot find these packages. Fortunately I can easily solve this by adding the command `set(CMAKE_MODULE_PATH "${FAIRROOTPATH}/share/fairbase/cmake/modules_old" ${CMAKE_MODULE_PATH})` after line 41.

The second thing is that all thorough FairRoot_install there are commands in the code like: `#include <boost/<<some path&file>>` But since there is no specification in this line where the directory boost is located, compilation of R3Broot gives trouble. Fortunately I can solve this by running the following command in the FairRoot_Install directory: `find ./ -type f -exec sed -i -e 's:#include <boost/:#include </home/christiaan/Desktop/FAIR/FairSoft_Build/include/boost/' {} \;` Then I have to run this command 10 times, each with a different number of blank characters between the # and the include to make sure that I really replace all commands with the complete path and then the problem disappears.

If more people are troubled by the same difficulties, is there a possibility to include an automatic fix inside FairRoot?

Thanks in advance!
Christiaan.

What do you mean by "newest update"? In case you cloned the repository from GitHub, on

which branch are you?

```
-----  
cd R3BRoot  
git branch  
-----
```

In case it is master, try

```
-----  
git checkout dev  
git pull  
-----
```

and then recompile in a completely fresh build directory.

Please specify also versions of FairSoft and FairRoot.

Cheers,
Dima

I obtained the new source code from R3Broot with the command
svn co https://subversion.gsi.de/fairroot/r3broot/release/jan15 r3broot

And I obtained the new source code from FairRoot with
git clone -b dev https://github.com/FairRootGroup/FairRoot.git

Christiaan.

Sounds like "oldest" version.

There was a post on R3BRoot Website:

<https://www.r3broot.gsi.de/repository-has-been-moved-github>

Use dev branch, as written in previous reply.

The same info and link was sent to r3b-ml-analyssis@r3b-nustar.de and
