Hello everyone,

I am not the person who will completely solve the 'dead material problem' of the EMC implementation in PandaROOT, but I would like to implement little things in order to make a more proper dose/fluence calculation ...

Can one give me a short intro ho to do it? Or some example ... or some help ... ?

Thanks inadvance,
Karoly

You can find some documentation on how to write geometry in the computing week indico (toy setup) and in the fairroot howto.
