Dear all,

now you can switch between different options of target in your simulation macros.
After your PndMasterRunSim initialization, you can add the following function:

```
PndMasterRunSim *fRun = new PndMasterRunSim();
```

```
...
```

```
fRun->SetTargetMode(XXX);
```

Where XXX is an integer number and can be:

0 - No IP smearing (default) 1 - Cluster Jet 2 - Pellet target 3 - Pellet Tracking target

This will change the shape of your interaction point. The numbers are extracted from the Target TDR.
