Hi all,

I have a rather no critical question but I would like it to be answered.
When I generate events i get this output in my terminal:

*** ERTRGO *** Boundary loop: track 1 stack 0 NTMULT 0 PION +
Precision now set to 0.150E-03

Is there a way to skip this "cout" ?????

Thanks

These are Geant3 warnings, actually there is no way to switch them OFF without touching the fortran code, if I remember correctly.

Thanks for your reply!!

If I use Geant 4 this is not happening???
If so, does Geant 4 work correctly??
I am using the last version of pandaroot (29475).

Thanks again

If you use G4 in simulation they will not appear. In any case, they are just warnings and nothing critical.
