
Subject: How to reconfigure and rerun a FairRunAna instance

Hi All,

I'm new to FairRoot, and would be happy to understand how to realize the following use case. In my root macro I need to run in a loop of several iterations reconstruction and subsequent computation of the mis-alignment corrections. For that, in plain language, I need twice per each iteration to "reset" the fRunAna instance, replace its set of tasks and i/o files, "reinit" it and run again. Its "singleton-ness" seems to prevent such a task from being solvable in a simple-minded way.

Any help will be very much appreciated.

Cheers,
- Anatoly

Dear Anatoly,

Thank you very much for your engagement.
Unfortunately we did not yet meet such a requirement from our users.
Could you please provide us with a simple macro, where such an example usage of FairRunAna would be presented?
We will then analyse the problem and try to apply fixes.

Thank you in advance,
Radoslaw Karabowicz
