
Subject: Negative lambda masses after VtxFit

Hi all,

I observed negative lambda masses after vertex fitting. Likewise, the mass distribution after the mass constraint fit is strange.

The mass distribution of the non-fitted lambda candidate seems to be fine. (See the attached plots!)

Is there anyone else observing this? I know that Albrecht has also unphysical masses for lambda.

I am using the standard simulation macros (for the task),

PandaRoot trunk rev. 30210

FairRoot v17.03

FairSoft mar17

The production was made on Kronos. I attached also the Dec-File.

I also tried a different trunk version (rev 30202), but the problem is still observable.

Best regards,

Jenny

Hi everyone,

I wish you a happy new year and I hope that all of you enjoyed your vacations.

Since my problem with the negative masses is still not solved, I would be very happy if anyone could also have a look at this problem

Cheers,

Jenny
