Subject: Visualization of trajectories from simulation

Hi

I am trying to figure out how to enable the visualization of trajectories using the event display.
For the moment, the only way I found is to go to FairEventManager, click on the particle and
click on the Refs tab (on the bottom of the GUI) and then click in any of the PathMarks. When I
do that, the trajectory appears. However, I do not understand the trajectory itself. In the
screenshot I attach, there is a proton coming out of the target and entering into a gaseous
volume I included there to debug. The Hits (blue squares) are correctly visualized but they do
not correspond to the trajectory of the particle (red line).

Thanks for your help

Yassid

Hi,
Are you sure that this is the only particle in simulation? In FairTrajFilter you can try to change
the cuts for visualization cuts. Maybe those hits are not from this proton.

Hi Yassid,

which task do you use to visualize the tracks? FairGeoTrackDraw or something else?
For PANDA the tracks are plotted directly after one selects on event.

Could it be that your hit points are wrong? It is hard to tell with the plots you uploaded up for
me it looks if in the projection along the beam the hits match with the track.

Cheers,

Tobias
